

A new hygiene concept in dentistry

(Varna, 03 March 2020): When it comes to the latest technologies in dentistry, digitisation is much talked about these days. However, the topic of hygiene is rarely addressed in the future visions of modern dentistry, really it is treated with a certain neglect and is generally taken for granted.

The already innovation-driven future planning of Dentaprimе is now also playing a pioneering role when it comes to clinic hygiene, because fully digitised treatment or the use of navigated implantology are already integrated into everyday clinical practice.

As part of the design of the new treatment centre in Varna on the Black Sea coast in Bulgaria, those responsible at Dentaprimе have developed a new hygiene concept called “Hyperhygiene” which goes far beyond the standard in conventional dental practices.

The concept includes the following hygiene measures:

- Non-contact opening and closing of all doors in the treatment centre
- The cleaning of shoe soles using special cleaning machines
- Disposable surgical gowns, surgical hoods and disposable gloves also for patients
- An air purification system that creates almost clean-room conditions.
